AUTOMATIC AUDIO RECORDER
BY COTEL TELECOM

Powered by Raspberry Pi

The Automatic Audio Recorder is powered by a Raspberry Pi and includes a PMR radio, programmed to the customer's frequency plan. When your staff transmit over the radio network, the Recorder will receive these messages and the audio will be stored in the Raspberry Pi. Your management can easily access the recordings by logging into the web interface from their browser – from here they can locate the recording by the desired date/time, and they can play back or download the audio with the easy-to-use interface. All recordings are stored for 21 days, and the web interface allows you to skip to a specific date and time to find the audio you're looking for.
