# Wireless Links

There are different types of Wireless Links, each with different applications to benefit your business:

- **WiFi Access Points.** WiFi is the backbone for any business, and a good access point will allow your devices to access the network without any issues. Access points come in several designs - they can sit on a desk, mount to the ceiling or even live outdoors.
- **PTMP (Point To Multi-Point) links** offer coverage over line-of-sight distances up to 2km. They are inexpensive, easy to configure and can easily bridge your network from A to B. They are also a reliable backbone for a CCTV network when cables aren't an option.
- **Cellular Boosters**, which receive a signal from outdoors, amplify it and release it as a stronger signal, are also a similar solution to sharing a wireless network. These are a good option if you need to share internet access but didn't have to share a specific private network/files.
